

No. 10. British Museum East Africa Expedition
Tendaguru via Lindi
14th. December, 1930.

The Director
British Museum (Natural History)

Sir,
There is little to report since my No. 9 of the 17th.
November.

At M 23 the last piece of the vertebral column consisting
of the Shoulder vertebra and Dorsal 1, have been packed and
dispatched - see boxes 206 and 297.

Further digging below and around has so far produced
nothing of importance.

I have examined the lower marine bed at Kindope. This is
the Nerinea zone. The upper marine bed, the Trigonina Smeel
zone, I collected on before going to Nyasaland. This lower one
one I failed at the time to locate on account of the grass.
The specimens of invertebrates collected, marked Kindope
marine bed no. 2. go home in box 208, with some more to
follow.

I need not go into details here, but enclose a vertical
plan I have made of the diggings and finds of invertebrates,
which explains itself.

Perhaps Dr. Kitchin might like to see these last finds,
as he does not consider the existing material from the
Nerinea zone very ample.

I shall be leaving here at the end of the month, and have
booked my passage by the "Mudasa" sailing about the 11th. of
January.

I am endeavouring to sell the expeditionary equipment.

I am,

Yours faithfully,

P.W.H. Migeod
